APS106

for loops.

Week 6 Lecture 1 (6.1)

Upcoming

- Term Test 1, Thursday at 7:00 pm.
- Lab 4 released 6:00 pm Thursday.
- Reflection 6 Released Friday 6:00 pm.
- Tutorial (Online), Practical, Office Hour sessions running all week.

if nothing else, write #cleancode.

This Week's Content

- Lecture 6.1
 - for loops
- Lecture 6.2
 - for loops on indices, nested loops
- Lecture 6.3
 - Design Problem: Cryptography

 Looping means repeating something over and over until a particular condition is satisfied.

Does the Tweet contain #cleancode

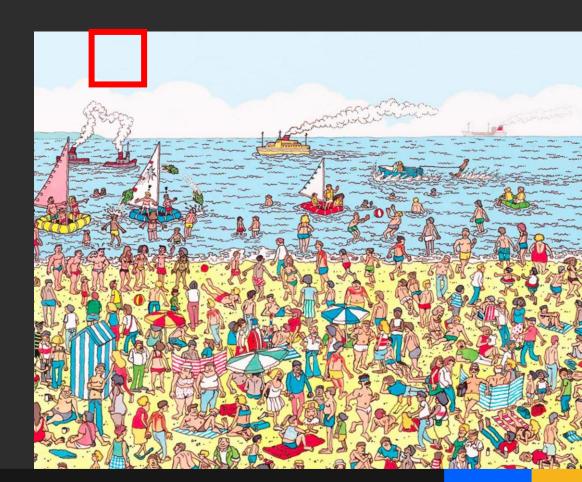

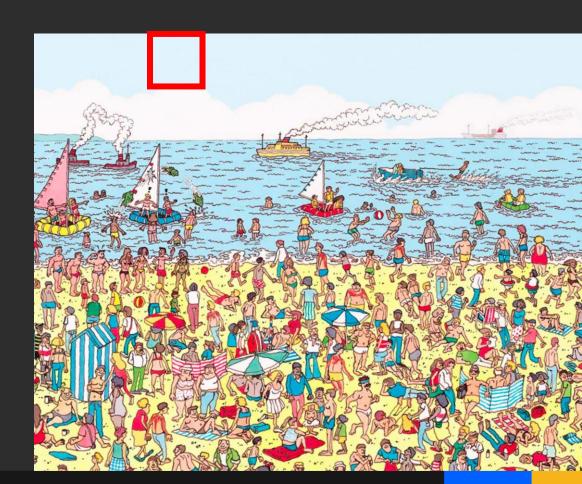

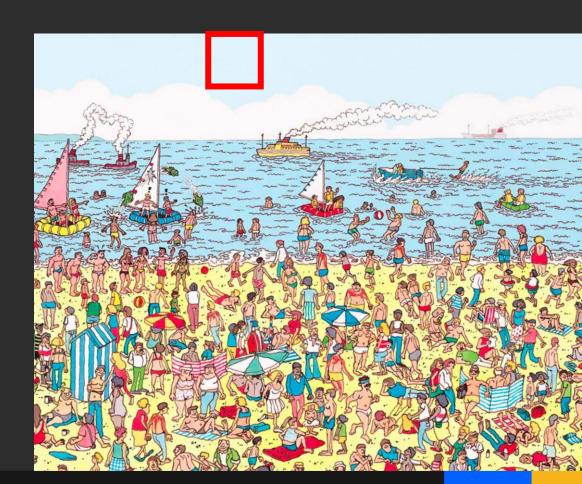

- There are several ways to repeat a block of code.
- We've already seen while loops and this week, we'll discuss for loops.
- Do Something = block of code we want to execute.

while expression:
 do something.

for item in iterable:
 do something.

A for loop starts with the keyword for.

```
name = 'Sebastian'
```

```
for character in name:
    print(character)
```

- Next, we provide the name of one of more variables.
- We have called the variable character, but you can call it whatever you like as long as it follows rules for naming a variable.

```
name = 'Sebastian'
```

```
for character in name:
    print(character)
```

for item1, item2 in iterable:
 do something.

Our variable character will be bound to each of the items in the sequence in turn.

```
name = 'Sebastian'
```

```
for character in name:
    print(character)
```

- Specify what the values are in.
- What is the iterable?
- An iterable is an object that can be iterated over.
- Strings are iterable (we know these from last week).
- Lists (next week) are iterable.

name = 'Sebastian'

for character in name:
 print(character)

- As with the while loop, the for loop statement ends with a colon.
- This is how Python knows you are going to create a new block of code.

name = 'Sebastian'

for character in name:
 print(character)

Indenting four spaces tells Python what lines of code are in that block you want to repeated.

```
name = 'Sebastian'
```

```
for character in name:
   print(character)
Indent
```

name = 'Sebastian'

What output should we get?

for character in name:
 print(character)

What output should we get?

```
name = 'Sebastian'
```

```
for character in name:
    print(character)
```

```
Output:
S
e
b
a
s
t
i
a
n
```

What output should we get?

```
name = 'Sebastian'
```

```
for character in name:
    print(character)
```

print (character)

What output should we get?

```
name = 'Sebastian'
```

```
for character in name:
    print(character)
```

print (character)

```
character holds
the value of the last
item in the iterable.
```

```
Output:

S
e
b
a
s
t
i
a
n
```

Let's try it ourselves.

1. Your first for loop

for vs while

- You've learned about for loops and while loops, but when should you use them?
- Firstly, all for loops can be written as while loops, and vice-versa.
- You should use a for loop when you know how many times the loop should run.
- If you want the loop to break based on a condition (do this until....) you should use a while loop.

for vs while

- Problem: You have had your **DNA** sequenced and each of your chromosomes is represented by a string of nucleotides: adenine (A), thymine (T), guanine (G), and cytosine (C).
- •chrome_4 = ATGGGCAA
- Create a function to count the number of occurrences of a nucleotides.

2. while vs for

```
i = 0
counter = 0
while i < len(chrome_4):
    if chrome_4[i] == 'A':
        counter += 1
    i += 1</pre>
```

Differences

```
counter = 0
for character in chrome_4:
    if character == 'A':
        counter += 1
```

```
i = 0
counter = 0
while i < len(chrome_4):
    if chrome_4[i] == 'A':
        counter += 1
    i += 1</pre>
```

```
counter = 0
for character in chrome_4:
   if character == 'A':
      counter += 1
```

- Differences
- In the while loop, the loop variable (i) was the index of each character, while in the for loop the loop variable (character) is the value of each character.
- No indexing [i] required in the for loop.

```
i = 0
counter = 0
while i < len(chrome 4):
    if chrome 4[i] == 'A':
        counter += 1
    i += 1
```

```
counter = 0
for character in chrome 4:
    if character == 'A':
        counter += 1
```

- Differences
- We do not have to worry about how long the string is (e.g., use len()) because the for loop will go through every character of the string exactly once.

```
i = 0
counter = 0
while i < len(chrome_4):
    if chrome_4[i] == 'A':
        counter += 1
    i += 1</pre>
```

```
counter = 0
for character in chrome_4:
    if character == 'A':
        counter += 1
```

- Differences
- We do not have to worry about incrementing the loop variable (i += 1) as the for loop takes care of this.

```
i = 0
counter = 0
while i < len(chrome_4):
    if chrome_4[i] == 'A':
        counter += 1
    i += 1</pre>
```

for

```
counter = 0
for character in chrome_4:
    if character == 'A':
        counter += 1
```

4 lines

6 lines

- Differences
- The for loop is MUCH easier to read and therefore, desirable when writing code for large collaborative projects.
- #cleancode

for vs while

- You should use a for loop when you know how many times the loop should run.
- If you want the loop to break based on a condition (do this until...) you should use a while loop.

while & for Loops

while & for Loops

for loop or while loop?

Breakout Session 1

- Write a function that takes in a string and returns the number of vowels in the string. (use for loop)
- Test 1
 - count_vowels('Happy
 Anniversary!')
 - **5**
- Test 2
 - count_vowels('xyz')
 - **8**

Vowels: a, e, i, o, u.

3. Breakout Session 1

Breakout Session 2

- Write a function to return the unique separators in a string of integer codes. (use for loop)
- The string only contains integers and separators.
- Test 1

```
find_seperators('23,613-23;2:45')
```

- ',-;:'
- Test 2
 - find_seperators('613-555-3224')
 - ' _ '

4. Breakout Session 2

Lecture Recap

Practice!

- for loops.
- Looping over strings.
- When to use a for loop over a while loop.

APS106

for loops.
